

第六次习题课解答 二重积分及计算

1. 求解下列各题:

$$(1) \text{求极限: } \lim_{n \rightarrow \infty} \sum_{j=1}^n \sum_{i=1}^n \frac{n}{(n+i)(n^2+j^2)}.$$

$$\text{解: } \lim_{n \rightarrow \infty} \sum_{j=1}^n \sum_{i=1}^n \frac{n}{(n+i)(n^2+j^2)} = \lim_{n \rightarrow \infty} \sum_{j=1}^n \sum_{i=1}^n \frac{1}{(1+\frac{i}{n})(1+(\frac{j}{n})^2)} \frac{1}{n^2}$$

$$= \iint_{\substack{0 \leq x \leq 1 \\ 0 \leq y \leq 1}} \frac{1}{(1+x)(1+y^2)} dx dy = \int_0^1 \frac{1}{1+x} dx \int_0^1 \frac{1}{1+y^2} dy = \frac{\pi}{4} \ln 2.$$

$$(2) \text{求 } f(x) = \int_1^x \sin t^2 dt \text{ 在 } [0,1] \text{ 上的平均值, 即求 } \int_0^1 f(x) dx.$$

$$\begin{aligned} \text{解: } \int_0^1 f(x) dx &= \int_0^1 (\int_1^x \sin t^2 dt) dx = - \int_0^1 (\int_x^1 \sin t^2 dt) dx \\ &= - \int_0^1 (\int_0^t \sin t^2 dx) dt = - \int_0^1 t \sin t^2 dt = \frac{1}{2}(\cos 1 - 1). \end{aligned}$$

$$(3) \text{当 } t \rightarrow 0^+ \text{ 时, 求无穷小量 } f(t) = \iint_{x^2+y^2 \leq t^2} (1-\cos(x^2+y^2)) dxdy \text{ 的阶。}$$

$$\begin{aligned} \text{解: 因为 } f(t) &= \iint_{x^2+y^2 \leq t^2} (1-\cos(x^2+y^2)) dxdy = \int_0^{2\pi} \left(\int_0^t (1-\cos r^2) r dr \right) d\theta \\ &= \pi(t^2 - \sin t^2) = \pi(t^2 - t^2 + \frac{1}{6}t^6 + o(t^6)) = \pi(\frac{1}{6}t^6 + o(t^6)), \end{aligned}$$

因此当 $t \rightarrow 0^+$ 时, $f(t)$ 是 6 阶无穷小量。

$$(4) \text{令 } D = \{(x, y) | x^2 + y^2 \leq 1, x \geq 0\}. \text{计算 } \iint_D \frac{1+xy}{1+x^2+y^2} dxdy.$$

解: 因为积分区域 D 关于 x 轴对称, 且 $\frac{xy}{1+x^2+y^2}$ 是 y 的奇函数, 因此

$$\iint_D \frac{xy}{1+x^2+y^2} dxdy = 0.$$

$$\text{故 } \iint_D \frac{1+xy}{1+x^2+y^2} dxdy = \iint_D \frac{1}{1+x^2+y^2} dxdy = \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \left(\int_0^1 \frac{r}{1+r^2} dr \right) d\theta = \frac{\pi}{2} \ln 2.$$

$$(5) \text{设 } F(t) = \int_0^t dx \int_x^t e^{x+y} \cos \sqrt{y} dy \quad (t > 0), \text{求 } F'(t).$$

$$\text{解: } F(t) = \int_0^t dx \int_x^t e^{x+y} \cos \sqrt{y} dy = \int_0^t e^y \cos \sqrt{y} dy \int_0^y e^x dx = \int_0^t e^y \cos \sqrt{y} (e^y - 1) dy,$$

$$\text{故 } F'(t) = e^t \cos \sqrt{t} (e^t - 1).$$

(6) 设 $f(x, y)$ 为连续函数且 $f(x, y) = f(y, x)$. 证明:

$$\int_0^1 dx \int_0^x f(x, y) dy = \int_0^1 dx \int_0^x f(1-x, 1-y) dy.$$

证: 令 $x = 1-u, y = 1-v$, 则 $0 \leq v \leq 1, 0 \leq u \leq v$, 且 $|\det \frac{\partial(x, y)}{\partial(u, v)}| = 1$. 于是

$$\int_0^1 dx \int_0^x f(1-x, 1-y) dy = \int_0^1 dv \int_0^v f(u, v) du = \int_0^1 dv \int_0^v f(v, u) du = \int_0^1 dx \int_0^x f(x, y) dy.$$

(7) 将定积分 $\int_0^1 \frac{\ln(1+x)}{(2-x)^2} dx$ 转化为二重积分计算。

$$\begin{aligned} \text{解: } \int_0^1 \frac{\ln(1+x)}{(2-x)^2} dx &= \int_0^1 \frac{1}{(2-x)^2} \left(\int_0^x \frac{1}{1+y} dy \right) dx = \int_0^1 \frac{1}{1+y} \left(\int_y^1 \frac{1}{(2-x)^2} dx \right) dy \\ &= \int_0^1 \frac{1}{1+y} \left(1 - \frac{1}{2-y} \right) dy = \frac{1}{3} \int_0^1 \left(\frac{2}{1+y} - \frac{1}{2-y} \right) dy = \frac{1}{3} \ln 2. \end{aligned}$$

(8) 设 $f(x) \in C[0, 1]$. 证明: $\int_0^1 e^{f(x)} dx \int_0^1 e^{-f(x)} dx \geq 1$.

证明: 令 $D = \{(x, y) \mid 0 \leq x \leq 1, 0 \leq y \leq 1\}$,

则 D 关于直线 $y=x$ 对称, 因此由轮换对称性,

$$\begin{aligned} \int_0^1 e^{f(x)} dx \int_0^1 e^{-f(x)} dx &= \int_0^1 e^{f(x)} dx \int_0^1 e^{-f(y)} dy = \iint_D e^{f(x)-f(y)} dxdy = \iint_D e^{f(y)-f(x)} dxdy \\ &= \frac{1}{2} \iint_D (e^{f(x)-f(y)} + e^{f(y)-f(x)}) dxdy \geq 1. \end{aligned}$$

2. 设 $\Omega \subset \mathbf{R}^3$ 是由锥面 $z = 1 - \sqrt{x^2 + y^2}$ 以及平面 $z = x$ 和 $x = 0$ 围成, 求空间区域 Ω 的体积。

解: 空间区域 Ω 在 xoy 坐标平面内的投影区域 D 由平面曲线 $1-x = \sqrt{x^2 + y^2}$ 以及直线

$x=0$ 围成, 且 D 在极坐标系下表示为 $D=\left\{(r, \theta) \mid -\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}, 0 \leq r \leq \frac{1}{1+\cos \theta}\right\}$, 因

此空间区域 Ω 的体积

$$\begin{aligned} V(\Omega) &= \iint_D (1 - \sqrt{x^2 + y^2} - x) dx dy = \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} d\theta \int_0^{\frac{1}{1+\cos\theta}} (1 - r(1 + \cos\theta)) r dr \\ &= \frac{1}{6} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \frac{1}{(1 + \cos\theta)^2} d\theta = \frac{1}{12} \int_{-\frac{\pi}{4}}^{\frac{\pi}{4}} \frac{1}{\cos^4\theta} d\theta = \frac{1}{12} \int_{-\frac{\pi}{4}}^{\frac{\pi}{4}} \left(\frac{1}{\cos^2\theta} + \frac{\tan^2\theta}{\cos^2\theta} \right) d\theta = \frac{2}{9}. \end{aligned}$$

3. 设平面区域 D 是介于圆周 $x^2 + y^2 = 4$ 与圆周 $(x+1)^2 + y^2 = 1$ 之间的部分。

$$\text{计算二重积分 } I = \iint_D (\sqrt{x^2 + y^2} + y) dx dy.$$

解: 积分区域 D 关于 x 轴对称, 故 $\iint_D y dx dy = 0$.

令 $D_1 = \{(x, y) \mid x^2 + y^2 \leq 4\}$, $D_2 = \{(x, y) \mid (x+1)^2 + y^2 \leq 1\}$, 则

$$\begin{aligned} I &= \iint_D \sqrt{x^2 + y^2} dx dy = \iint_{D_1} \sqrt{x^2 + y^2} dx dy - \iint_{D_2} \sqrt{x^2 + y^2} dx dy \\ &= \int_0^{2\pi} d\theta \int_0^2 r^2 dr - \int_{\frac{\pi}{2}}^{\frac{3\pi}{2}} d\theta \int_0^{-2\cos\theta} r^2 dr = \frac{16}{9}(3\pi - 2). \end{aligned}$$

4. 设 $f(x, y) \in C^2$ 且满足 $f(1, y) = 0$, $f(x, 1) = 0$, $\iint_D f(x, y) dx dy = a$, 其中

$D = \{(x, y) \mid 0 \leq x \leq 1, 0 \leq y \leq 1\}$. 计算二重积分 $\iint_D xy f''_{xy}(x, y) dx dy$.

解: 因为 $f(1, y) = 0$, $f(x, 1) = 0$, 因此 $f'_y(1, y) = 0$, $f'_x(x, 1) = 0$. 这样

$$\begin{aligned} \iint_D xy f''_{xy}(x, y) dx dy &= \int_0^1 x dx \int_0^1 y f''_{xy}(x, y) dy = \int_0^1 x \left(y f'_x(x, y) \Big|_{y=0}^{y=1} - \int_0^1 f'_x(x, y) dy \right) dx \\ &= - \int_0^1 dy \int_0^1 x f'_x(x, y) dx = \int_0^1 \left(x f(x, y) \Big|_0^1 - \int_0^1 f(x, y) dx \right) dy \\ &= \int_0^1 \int_0^1 f(x, y) dx dy = a. \end{aligned}$$

5. 记 $D_\delta = \{(x, y) \mid \delta^2 \leq x^2 + y^2 \leq 1\}$. 设 $f(x, y) \in C^1$ 满足当 $x^2 + y^2 = 1$ 时, 有

$$f(x, y) = 0. \text{ 证明: } \lim_{\delta \rightarrow 0^+} \iint_{D_\delta} \frac{xf'_x(x, y) + yf'_y(x, y)}{x^2 + y^2} dxdy = -2\pi f(0, 0).$$

证明: 令 $\begin{cases} x = r \cos \theta \\ y = r \sin \theta \end{cases}$ 并记 $u(r, \theta) = f(r \cos \theta, r \sin \theta)$. 则

$$u_r'(r, \theta) = \cos \theta f'_x + \sin \theta f'_y = \frac{1}{r} (xf'_x(x, y) + yf'_y(x, y)).$$

$$\begin{aligned} \text{故 } \iint_{D_\delta} \frac{xf'_x(x, y) + yf'_y(x, y)}{x^2 + y^2} dxdy &= \iint_{D_\delta} \frac{ru_r'(r, \theta)}{r^2} rdrd\theta = \iint_{D_\delta} u_r'(r, \theta) drd\theta \\ &= \int_0^{2\pi} d\theta \int_\delta^1 u_r'(r, \theta) dr = \int_0^{2\pi} (u(1, \theta) - u(\delta, \theta)) d\theta \\ &= \int_0^{2\pi} (f(\cos \theta, \sin \theta) - f(\delta \cos \theta, \delta \sin \theta)) d\theta \\ &= - \int_0^{2\pi} f(\delta \cos \theta, \delta \sin \theta) d\theta \\ &= -2\pi f(\delta \cos \varphi, \delta \sin \varphi), \end{aligned}$$

其中 $\varphi \in (0, 2\pi)$. 因为 $f(x, y) \in C^1$, 所以 $f(x, y)$ 在 $(0, 0)$ 连续, 从而

$$\lim_{\delta \rightarrow 0^+} \iint_{D_\delta} \frac{xf'_x(x, y) + yf'_y(x, y)}{x^2 + y^2} dxdy = -2\pi \lim_{\delta \rightarrow 0^+} f(\delta \cos \varphi, \delta \sin \varphi) = -2\pi f(0, 0).$$

6. 记 $D = \{(x, y) \mid |x| \leq a, |y| \leq a\}$. 设 $f(x)$ 是连续偶函数,

$$\text{证明: } \iint_D f(x-y) dxdy = 2 \int_0^{2a} (2a-u) f(u) du.$$

证明: 令 $\begin{cases} u = x - y \\ v = x + y. \end{cases}$ 则 $\begin{cases} x = \frac{1}{2}(u+v) \\ y = \frac{1}{2}(v-u) \end{cases}$

且 $D = \{(x, y) \mid |x| \leq a, |y| \leq a\}$ 转化为新坐标系下的区域

$$D_1 = \{(u, v) \mid |u| + |v| \leq 2a\}, \text{ 且 } |\det \frac{\partial(x, y)}{\partial(u, v)}| = \begin{vmatrix} \frac{1}{2} & \frac{1}{2} \\ -\frac{1}{2} & \frac{1}{2} \end{vmatrix} = \frac{1}{2}.$$

$$\text{故 } \iint_D f(x-y) dxdy = \frac{1}{2} \iint_{D_1} f(u) du dv = \frac{1}{2} \int_0^{2a} du \int_{-2a+u}^{2a-u} f(u) dv = 2 \int_0^{2a} (2a-u) f(u) du.$$

7. 设 $f(x, y) \in C^2$ 且关于两个变量 x 和 y 的周期都为 1, 即对任意的 (x, y) ,

$f(x+1, y) = f(x, y), \quad f(x, 1+y) = f(x, y)$. 若 $f(x, y)$ 满足

$$\int_{-1}^1 dx \int_{-1}^1 f(x, y)(f''_{xx}(x, y) + f''_{yy}(x, y))dy \geq 0, \text{ 证明: } f(x, y) \text{ 是常函数。}$$

证明: 因为

$$\begin{aligned} & \int_{-1}^1 dx \int_{-1}^1 f(x, y)(f''_{xx}(x, y) + f''_{yy}(x, y))dy \\ &= \int_{-1}^1 dx \int_{-1}^1 f(x, y)f''_{xx}(x, y)dy + \int_{-1}^1 dx \int_{-1}^1 f(x, y)f''_{yy}(x, y)dy, \end{aligned}$$

而

$$\begin{aligned} & \int_{-1}^1 dx \int_{-1}^1 f(x, y)f''_{xx}(x, y)dy = \int_{-1}^1 dy \int_{-1}^1 f(x, y)f''_{xx}(x, y)dx \\ &= \int_{-1}^1 (f(x, y)f'_x(x, y) \Big|_{x=-1}^{x=1} - \int_{-1}^1 (f'_x(x, y))^2 dx)dy \\ &= - \int_{-1}^1 (\int_{-1}^1 (f'_x(x, y))^2 dx)dy \\ &= - \iint_{\substack{|x| \leq 1 \\ |y| \leq 1}} (f'_x(x, y))^2 dxdy, \end{aligned}$$

$$\begin{aligned} & \int_{-1}^1 dx \int_{-1}^1 f(x, y)f''_{yy}(x, y)dy \\ &= \int_{-1}^1 (f(x, y)f'_y(x, y) \Big|_{y=-1}^{y=1} - \int_{-1}^1 (f'_y(x, y))^2 dy)dx \\ &= - \int_{-1}^1 (\int_{-1}^1 (f'_y(x, y))^2 dy)dx \\ &= - \iint_{\substack{|x| \leq 1 \\ |y| \leq 1}} (f'_y(x, y))^2 dxdy, \end{aligned}$$

故当 $\int_{-1}^1 dx \int_{-1}^1 f(x, y)(f''_{xx}(x, y) + f''_{yy}(x, y))dy \geq 0$ 时,

$$\text{必有 } \iint_{\substack{|x| \leq 1 \\ |y| \leq 1}} [(f'_x(x, y))^2 + (f'_y(x, y))^2] dxdy \leq 0,$$

由于 $(f'_x(x, y))^2 + (f'_y(x, y))^2$ 是非负连续函数,

因此对 $\forall (x, y)$ 满足 $|x| \leq 1, |y| \leq 1$, 有 $(f'_x(x, y))^2 + (f'_y(x, y))^2 = 0$.

从而对 $\forall (x, y)$ 满足 $|x| \leq 1, |y| \leq 1$, $f'_x(x, y) = 0$ 且 $f'_y(x, y) = 0$,

这样 $f(x, y)$ 在区域 $\{(x, y) \mid |x| \leq 1, |y| \leq 1\}$ 上是常数。

由函数 $f(x, y)$ 的周期性知, $f(x, y)$ 在其定义域上是常数。

8. 设二元函数 $f(x, y)$ 在开单位圆盘 $D: x^2 + y^2 < 1$ 上是 C^2 的，在闭单位圆盘 $\bar{D}: x^2 + y^2 \leq 1$ 上连续。若函数 $f(x, y)$ 在单位圆周 $x^2 + y^2 = 1$ 上取值为常数零，证

$$\text{明: } \iint_{x^2+y^2 \leq 1} f(x, y)[f''_{xx}(x, y) + f''_{yy}(x, y)]dxdy \leq 0.$$

证明：将重积分化为累次积分，然后再做分部积分，并利用假设条件。

$$\begin{aligned} \iint_{x^2+y^2 \leq 1} f(x, y)f''_{xx}(x, y)dxdy &= \int_{-1}^1 dy \int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} f(x, y)f''_{xx}(x, y)dx = \int_{-1}^1 dy \int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} f df'_x \\ &= \int_{-1}^1 \left[f(x, y)f'_x(x, y) \Big|_{x=-\sqrt{1-y^2}}^{x=\sqrt{1-y^2}} - \int_{-\sqrt{1-y}}^{\sqrt{1-y}} f'_x(x, y)^2 dx \right] dy = - \iint_{x^2+y^2 \leq 1} f'_x(x, y)^2 dxdy \leq 0. \end{aligned}$$

同理可证 $\iint_{x^2+y^2 \leq 1} f(x, y)f''_{yy}(x, y)dxdy = - \iint_{x^2+y^2 \leq 1} f'_y(x, y)^2 dxdy \leq 0$. 因此

$$\iint_{x^2+y^2 \leq 1} f(x, y)[f''_{xx}(x, y) + f''_{yy}(x, y)]dxdy \leq 0. \text{ 证毕}$$

9. 设 $f(x) \in C[0, 1]$ 且 $0 < m \leq f(x) \leq M$ ($\forall x \in [0, 1]$).

$$\text{证明: } \iint_{\substack{0 \leq x \leq 1 \\ 0 \leq y \leq 1}} \frac{f(x)}{f(y)} dxdy \leq \frac{(M+m)^2}{4Mm}.$$

$$\text{证明: } \iint_{\substack{0 \leq x \leq 1 \\ 0 \leq y \leq 1}} \frac{f(x)}{f(y)} dxdy = \int_0^1 \frac{1}{f(y)} dy \int_0^1 f(x) dx = \int_0^1 \frac{1}{f(x)} dx \int_0^1 f(x) dx.$$

因为 $\forall x \in [0, 1]$, $(M - f(x))(f(x) - m) \geq 0$,

$$\text{因此 } (M+m)f(x) \geq f^2(x) + Mm, \text{ 从而 } M+m \geq f(x) + \frac{Mm}{f(x)},$$

$$\text{两边积分得, } M+m \geq \int_0^1 f(x) dx + Mm \int_0^1 \frac{1}{f(x)} dx,$$

$$\text{记 } a = \int_0^1 f(x) dx, b = \int_0^1 \frac{1}{f(x)} dx, \text{ 则 } M+m \geq b+aMm \geq 2\sqrt{abMm},$$

$$\text{故 } ab \leq \frac{(M+m)^2}{Mm}. \text{ 所以 } \iint_{\substack{0 \leq x \leq 1 \\ 0 \leq y \leq 1}} \frac{f(x)}{f(y)} dxdy = ab \leq \frac{(M+m)^2}{4Mm}.$$

10. 计算下列二重积分:

$$(1) \iint_D |xy| dx dy, \text{ 其中 } D \text{ 为圆域: } x^2 + y^2 \leq a^2.$$

解: 由对称性有

$$\begin{aligned} \iint_D |xy| dx dy &= 4 \int_0^{\frac{\pi}{2}} d\theta \int_0^a r \sin \theta \cdot r \cos \theta \cdot r dr \\ &= 4 \int_0^{\frac{\pi}{2}} \frac{1}{2} \sin 2\theta d\theta \cdot \int_0^a r^3 dr = 2 \cdot \frac{-\cos 2\theta}{2} \Big|_0^{\frac{\pi}{2}} \cdot \frac{r^4}{4} \Big|_0^a = \frac{a^4}{2}. \end{aligned}$$

$$(2) \iint_D (x+y) \sin(x-y) dx dy, D = \{(x,y) \mid 0 \leq x+y \leq \pi, 0 \leq x-y \leq \pi\};$$

解: 令 $x = \frac{1}{2}(u+v)$, $y = \frac{1}{2}(u-v)$, 则 $D' = \{(u,v) \mid 0 \leq u \leq \pi, 0 \leq v \leq \pi\}$,

$$\left| \det \frac{\partial(x,y)}{\partial(u,v)} \right| = \frac{1}{2}. \text{ 于是}$$

$$\iint_D (x+y) \sin(x-y) dx dy = \iint_{D'} u \sin v \cdot \frac{1}{2} du dv = \frac{1}{2} \int_0^\pi u du \int_0^\pi \sin v dv = \frac{1}{2} \pi^2.$$

$$(3) \iint_D e^{\frac{y}{x+y}} dx dy, D = \{(x,y) \mid x+y \leq 1, x \geq 0, y \geq 0\}.$$

解: 令 $x = v-u$, $y = u$, 则 $D' = \{(u,v) \mid 0 \leq u \leq v, 0 \leq v \leq 1\}$, $\left| \det \frac{\partial(x,y)}{\partial(u,v)} \right| = 1$.

$$\text{于是 } \iint_D e^{\frac{y}{x+y}} dx dy = \iint_{D'} e^{\frac{u}{v-u}} du dv = \int_0^1 dv \int_0^v e^{\frac{u}{v-u}} du = \frac{1}{2}(e-1).$$

$$11. \text{ 求由曲线所围的平面图形面积: } \left(\frac{x^2}{a^2} + \frac{y^2}{b^2} \right)^2 = x^2 + y^2.$$

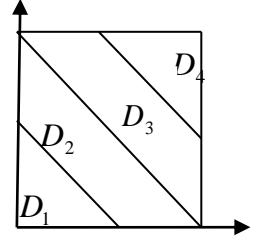

解: 令 $x = ar \cos \theta$, $y = br \sin \theta$, 则 $\left| \det \frac{\partial(x,y)}{\partial(r,\theta)} \right| = abr$,

$$D' = \{(r,\theta) \mid 0 \leq \theta \leq 2\pi, 0 \leq r \leq \sqrt{a^2 \cos^2 \theta + b^2 \sin^2 \theta}\}.$$

于是所求面积

$$\begin{aligned} S(D) &= \iint_D dx dy = \iint_{D'} ab r dr d\theta = ab \int_0^{2\pi} d\theta \int_0^{\sqrt{a^2 \cos^2 \theta + b^2 \sin^2 \theta}} r dr \\ &= \frac{1}{2} ab \pi (a^2 + b^2). \end{aligned}$$

12. 求 $I = \iint_D [x+y] d\sigma$, 其中 $D = [0,2] \times [0,2]$, $[x+y]$ 为取整函数。

解：为方便，对 D 作分解 $D = D_1 \cup D_2 \cup D_3 \cup D_4$, 如图。于是

$$\begin{aligned} I &= \iint_D [x+y] d\sigma = \iint_{D_1} [x+y] d\sigma + \iint_{D_2} [x+y] d\sigma + \iint_{D_3} [x+y] d\sigma + \iint_{D_4} [x+y] d\sigma \\ &= \iint_{D_1} 0 d\sigma + \iint_{D_2} 1 \cdot d\sigma + \iint_{D_3} 2 \cdot d\sigma + \iint_{D_4} 3 \cdot d\sigma \\ &= S(D_2) + 2S(D_3) + 3S(D_4) = 6. \end{aligned}$$

其中 $S(D_2) = S(D_3) = \frac{3}{2}$, $S(D_1) = S(D_4) = \frac{1}{2}$, 解答完毕。

13. 计算 $I = \iint_D \frac{1}{\sqrt{x^2 + y^2}} \left(y \frac{\partial f}{\partial x} - x \frac{\partial f}{\partial y} \right) dx dy$, 其中 $D = \{(x, y) | x^2 + y^2 \leq R^2\}$ 且 $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \in C(D)$.

解：考虑极坐标系 $\begin{cases} x = \rho \cos \theta \\ y = \rho \sin \theta \end{cases}$, $dx dy = \rho d\rho d\theta$. 则

$$\frac{1}{\sqrt{x^2 + y^2}} \left(y \frac{\partial f}{\partial x} - x \frac{\partial f}{\partial y} \right) = \frac{1}{\rho} \frac{\partial f}{\partial(x, y)} \begin{pmatrix} y \\ -x \end{pmatrix} = \frac{1}{\rho} \frac{\partial f}{\partial(\rho, \theta)} \cdot \frac{\partial(\rho, \theta)}{\partial(x, y)} \begin{pmatrix} y \\ -x \end{pmatrix} = -\frac{1}{\rho} \frac{\partial f}{\partial \theta},$$

$$\begin{aligned} \text{其中 } \frac{\partial(\rho, \theta)}{\partial(x, y)} \begin{pmatrix} y \\ -x \end{pmatrix} &= \left(\frac{\partial(x, y)}{\partial(\rho, \theta)} \right)^{-1} \begin{pmatrix} y \\ -x \end{pmatrix} = \begin{pmatrix} \cos \theta & -\rho \sin \theta \\ \sin \theta & \rho \cos \theta \end{pmatrix}^{-1} \begin{pmatrix} y \\ -x \end{pmatrix} \\ &= \frac{1}{\rho} \begin{pmatrix} \rho \cos \theta & \rho \sin \theta \\ -\sin \theta & \cos \theta \end{pmatrix} \begin{pmatrix} y \\ -x \end{pmatrix} = \frac{1}{\rho} \begin{pmatrix} 0 \\ -1 \end{pmatrix} = \begin{pmatrix} 0 \\ -1 \end{pmatrix}. \end{aligned}$$

$$\text{故 } I = \iint_D \frac{1}{\sqrt{x^2 + y^2}} \left(y \frac{\partial f}{\partial x} - x \frac{\partial f}{\partial y} \right) d\sigma = - \iint_{0 \leq \rho \leq R, 0 \leq \theta \leq 2\pi} \frac{1}{\rho} \frac{\partial f}{\partial \theta} \rho d\rho d\theta$$

$$= - \int_0^R d\rho \int_0^{2\pi} \frac{\partial f}{\partial \theta} d\theta = - \int_0^R (f(\rho, 2\pi) - f(\rho, 0)) d\rho = 0.$$

14. 计算 $I = \iint_D |x^2 + y^2 - 4| d\sigma$, $D = \{(x, y) | x^2 + y^2 \leq 16\}$.

解：记 $D = D_1 \cup D_2$, $D_1 : x^2 + y^2 \leq 4$, $D_2 : 4 \leq x^2 + y^2 \leq 16$, 则

$$\begin{aligned} I &= \iint_{D_1} (4 - x^2 - y^2) d\sigma + \iint_{D_2} (x^2 + y^2 - 4) d\sigma = \int_0^{2\pi} d\phi \int_0^2 (4 - r^2) r dr + \int_0^{2\pi} d\phi \int_2^4 (r^2 - 4) r dr \\ &= 2\pi \left(2r^2 - \frac{r^4}{4} \right) \Big|_0^2 + 2\pi \left(\frac{r^4}{4} - 2r^2 \right) \Big|_2^4 = 80\pi. \end{aligned}$$

$$\begin{aligned} \text{或者 } I &= - \iint_{D_1} (x^2 + y^2 - 4) d\sigma + \iint_{D_2} (x^2 + y^2 - 4) d\sigma \\ &= \iint_{D_1 \cup D_2} (x^2 + y^2 - 4) d\sigma - 2 \iint_{D_1} (x^2 + y^2 - 4) d\sigma \\ &= \int_0^{2\pi} d\phi \int_0^4 (r^2 - 4) r dr - 2 \int_0^{2\pi} d\phi \int_0^2 (r^2 - 4) r dr = 80\pi. \end{aligned}$$

解答完毕。

15. 利用二重积分理论，证明下列结论：设 $f(x)$, $g(x)$ 在 $[a, b]$ 上连续，则

$$(1) \left(\int_a^b f(x) dx \right)^2 \leq (b-a) \int_a^b f^2(x) dx;$$

$$(2) \left(\int_a^b f(x)g(x) dx \right)^2 \leq \int_a^b f^2(x) dx \int_a^b g^2(x) dx.$$

$$(3) \int_a^b dx \int_x^b f(x)f(y) dy = \frac{1}{2} \left(\int_a^b f(x) dx \right)^2.$$

证明：

$$\begin{aligned} (1) \quad & \left(\int_a^b f(x) dx \right)^2 = \int_a^b f(x) dx \int_a^b f(y) dy = \iint_{[a,b] \times [a,b]} f(x)f(y) dx dy \\ & \leq \frac{1}{2} \iint_{[a,b] \times [a,b]} [f^2(x) + f^2(y)] dx dy = \frac{1}{2} \iint_{[a,b] \times [a,b]} f^2(x) dx dy + \frac{1}{2} \iint_{[a,b] \times [a,b]} f^2(y) dx dy \\ & = \frac{1}{2} (b-a) \int_a^b f^2(x) dx + \frac{1}{2} \int_a^b f^2(y) dy = (b-a) \int_a^b f^2(x) dx. \end{aligned}$$

(2) 由不等式 $[f(x)g(y) - f(y)g(x)]^2 \geq 0$ 得

$$0 \leq \iint_{[a,b] \times [a,b]} [f(x)g(y) - f(y)g(x)]^2 dx dy$$

$$\begin{aligned}
&= \iint_{[a,b] \times [a,b]} [f^2(x)g^2(y) + f^2(y)g^2(x) - 2f(x)g(x)f(y)g(y)] dx dy \\
&= 2 \int_a^b f^2(x) dx \int_a^b g^2(x) dx - 2 \left(\int_a^b f(x)g(x) dx \right)^2. \text{ 由此立刻得到不等式(2).}
\end{aligned}$$

(3) 令 $D = \{(x, y) | a \leq x \leq b, x \leq y \leq b\}$, $E = \{(x, y) | a \leq x \leq b, a \leq y \leq x\}$. 则

D 与 E 关于 $y=x$ 对称, 因此

$$\int_a^b dx \int_x^b f(x)f(y) dy = \frac{1}{2} \int_a^b f(x) dx \int_a^b f(y) dy = \frac{1}{2} \left(\int_a^b f(x) dx \right)^2.$$

=====

以下内容为学有余力的同学选做。

16. 设函数 $f(x, y)$ 及其偏导数 $f'_y(x, y)$ 在平面区域 D 上连续, 其中

$D = \{(x, y) | a \leq x \leq b, \varphi(x) \leq y \leq \psi(x)\}$, 这里 $\varphi(x)$ 和 $\psi(x)$ 为 $[a, b]$ 上的连续函数, 且

$\varphi(x) \leq \psi(x)$. 进一步假设 $f(x, \varphi(x)) = 0$, $\forall x \in [a, b]$. 证明存在常数 $C > 0$, 使得

$$\iint_D f^2(x, y) dx dy \leq C \iint_D (f'_y(x, y))^2 dx dy. \text{ (这个不等式称作 Poincare 不等式)}$$

证明: 根据假设和 Newton—Leibniz 公式得 $f(x, y) = \int_{\varphi(x)}^y f'_y(x, t) dt$.

两边平方并应用 Cauchy-Schwarz 不等式得

$$f^2(x, y) = \left(\int_{\varphi(x)}^y f'_y(x, t) dt \right)^2 \leq (y - \varphi(x)) \int_{\varphi(x)}^y (f'_y(x, t))^2 dt \leq [\psi(x) - \varphi(x)] \int_{\varphi(x)}^{\psi(x)} (f'_y(x, y))^2 dy$$

两边关于 y 在区间 $[\varphi(x), \psi(x)]$ 上积分得

$$\int_{\varphi(x)}^{\psi(x)} f^2(x, y) dy \leq [\psi(x) - \varphi(x)]^2 \int_{\varphi(x)}^{\psi(x)} (f'_y(x, y))^2 dy.$$

$$\text{记 } C = \max\{[\psi(x) - \varphi(x)]^2, a \leq x \leq b\}. \text{ 则 } \int_{\varphi(x)}^{\psi(x)} f^2(x, y) dy \leq C \int_{\varphi(x)}^{\psi(x)} (f'_y(x, y))^2 dy.$$

$$\text{对上述不等式关于 } x \text{ 在区间 } [a, b] \text{ 上积分得 } \int_a^b dx \int_{\varphi(x)}^{\psi(x)} f^2(x, y) dy \leq C \int_a^b dx \int_{\varphi(x)}^{\psi(x)} (f'_y(x, y))^2 dy.$$

再将上式两边的累次积分换成重积分, 即得所要证明的 Poincare 不等式。证毕。

以下两题为广义重积分的计算（这部分内容大纲不做要求，同学们根据自己的情况自由选择练习）

1. 计算二重广义积分 $\iint_{R^2} e^{-(x^2+y^2)} \sin(x^2+y^2) dx dy$ 。（第三章总复习题题 7 (2), page 171.)

解：作极坐标变换： $x = r \cos t$, $y = r \sin t$, 则所求积分为

$$\iint_{0 \leq r < +\infty, 0 \leq t \leq 2\pi} e^{-r^2} \sin r^2 r dr dt = \int_0^{2\pi} dt \frac{1}{2} \int_0^{+\infty} e^{-s} \sin s ds$$

注意 $\int_0^{+\infty} e^{-s} \sin s ds = \frac{-e^{-s}(\cos s + \sin s)}{2} \Big|_{s=0}^{s=+\infty} = \frac{1}{2}$ 。于是我们得到

$$\iint_{R^2} e^{-(x^2+y^2)} \sin(x^2+y^2) dx dy = \frac{\pi}{2}。解答完毕。$$

2. 计算二重广义积分 $\iint_{R^2} e^{2xy-2x^2-y^2} dx dy$ 。（第三章总复习题题 7 (3), page 171)

解：注意 $2xy - 2x^2 - y^2 = -(x-y)^2 - x^2$ 。令 $u = x$, $v = x-y$, 则

其逆变换为 $x = u$, $y = u-v$ 。于是原积分等于

$$\iint_{R^2} e^{2xy-2x^2-y^2} dx dy = \iint_{R^2} e^{-u^2-v^2} \left| \det \begin{vmatrix} \frac{\partial(x,y)}{\partial(u,v)} \end{vmatrix} \right| du dv = \int_{-\infty}^{+\infty} e^{-u^2} du \int_{-\infty}^{+\infty} e^{-v^2} dv = \sqrt{\pi} \sqrt{\pi} = \pi。解$$

答完毕。
